

MALOSSI F32 Fork Adjustment

(with thanks to Malossi Tech Centre - Taffspeed)

The 32mm forks have two adjustments. The blue knobs on the top of each fork leg adjust spring preload, They should both be set the same number of turns.

Start fully out which is the weakest spring setting and try various quarter tune adjustments. There should be some movement when the scooter is off the stand and some more when you sit on it. With your weight on - around 15 mm of movement compared to fully extended is a good starting point.

If you want the forks harder - screw the adjusters in further, for softer - screw them out, but make sure each adjuster is turned by the same amount.

On the disc side fork leg is a black circular disc. This adjusts the damping. Set to your own preference. The usual settings are either 2 or 3 turns according to your weight and riding style . E & O E 2003
